Steamulation Pro X (Gen.III)

The Best - even better!

Steamulation Purge Pro X III

The Steamulation Pro X III features the world's most advanced purge system for multi-hose shishas. The unique Steamulation Purge Pro valves allow any user to easily blow out the bowl without having to remove valve balls. The valves on all four smoke ports work automatically in both directions (smoke & blow out). The intelligent system can even compensate for overpressure in the shisha and then use the free hose connections to blow off if necessary. The system has been optimized and improved again compared to the previous generation.

Steamulation High-Flow System

The Steamulation Pro X (Gen.III) has been optimized in terms of flow technology and provided with larger flow cross-sections. The draught has been increased by 25% compared to the predecessor. At the same time, the adjustment range of the Steamulation Advanced Airflow Control is increased.

Steamulation AirFlow Control

The Steamulation Pro X III allows its users to individually adjust the draft at each hose connection as desired using the Steamulation Airflow Control between traditional and modern. Compared to its predecessor, the maximum draft has been increased and the hose connections have been adjusted to direct moisture back into the base. In addition, the connections can now be completely closed to turn off the overpressure function.

Steamulation Dip Tube Control

With the new Dip Tube Control, you can determine the length of the dip tube yourself in 10 different steps, thereby further customizing the pull and tightening of your Pro X.

Advanced Diffuser

The new Advanced Diffuser is inspired by the well-known Steamulation Cooling Diffuser. A floatable ball in the diffuser prevents the water column from rising and swinging in the immersion tube. On the one hand, this complements the overpressure function by making flooding of the hookah impossible. On the other hand, the smoking behaviour is very positively influenced, as the swinging of the water column is effectively dampened. When tightening, a pleasant draught and tightening occurs immediately, since water does not have to be displaced from the dip tube first. Also, this function offers today exclusively only Steamulation and is not found in any other hookah on the market.

X Blow Off +

With the Steamulation Pro X III, the well-known X Blow Off is supplemented by a plate Blow Off. The plate Blow Off can be activated and deactivated by turning the Blow Off plate below the coal plate. With the familiar X Blow Off of its predecessor, the Steamulation Pro X III now offers 31 different Blow Off options. Choose your favorite!

Cooling Control Adapter

A new feature is the optional cooling control adapter. This optionally directs part of the exhaust air back into the upper smoke column to the tobacco head. This allows the tobacco head to be cooled in a targeted manner. The amount of air is adjustable and can either be switched off or remain permanently activated. The cooling control is simply inserted between the base and the smoke column and can be combined with all X Blow Offs and sleeves. [Note: When the Cooling System is inserted, the blow-off pressure increases slightly. This causes the overpressure function to respond earlier. If this is not desired, the overpressure function can be deactivated at the unused smoke connections by closing the AirFlow Control].
